AI-Powered Financial Report Analysis - Powered by Experian

Problem Statement

In today's data-driven business environment, financial teams rely on large volumes of reports and datasets to assess performance, identify risks, and support decision-making. However, reviewing financial documents manually can be time-consuming, inefficient, and susceptible to human error, especially when dealing with information spread across multiple formats and sources.

Your challenge is to develop an AI-powered solution that streamlines the analysis of financial reports. The tool should be capable of extracting and interpreting key financial information from structured and unstructured sources such as PDF documents and spreadsheets, identifying trends, anomalies, and noteworthy insights, and presenting findings in a clear and user-friendly format.

The solution should enable users to make faster, more informed decisions by transforming complex financial data into actionable insights while improving productivity and accuracy.

Key Requirements

- Extract relevant financial information from documents such as PDFs and spreadsheets.
- Analyse data to identify trends, patterns, exceptions, and potential risks.
- Generate concise summaries and recommendations for users.
- Present insights through an intuitive dashboard, report, or conversational interface.
- Demonstrate explainability and transparency in how insights are generated.

Data Privacy & Compliance Requirements

To align with the Personal Data Protection Act (PDPA) Malaysia and responsible AI practices, proposed solutions must:

- Process only the data necessary for the intended analysis.
- Avoid collecting, storing, or exposing personally identifiable information (PII) unless explicitly required and appropriately protected.
- Implement appropriate security measures to safeguard data confidentiality and integrity.

- Include mechanisms to mask, anonymise, or redact personal information where applicable.
- Ensure users maintain control over uploaded data, including data retention and deletion considerations.
- Clearly communicate how data is used, processed, and protected within the solution.

Success Criteria

Solutions will be evaluated based on:

- Innovation and creativity
- Accuracy and quality of insights
- User experience and usability
- Scalability and business value
- Data privacy, security, and PDPA compliance
- Responsible and ethical use of AI
