PDF-Only Accounts-Payable Automation Scenario

This guide describes a complete demonstration in which a finance analyst uploads six fictional PDFs in one batch. The system must extract each document separately, normalize the fields, link the records, detect control failures, explain the risk, and route the case for human review.

Business story

Vertex Retail Operations purchased IT equipment from Nexa Office Solutions. The finance team received a supplier profile, purchase order, original invoice, reissued invoice, delivery order, and payment receipt. Although the documents describe the same purchase, several inconsistencies indicate that another payment must not be processed automatically.

UPLOAD ORDER	DOCUMENT	ROLE IN THE AUTOMATION
1	Supplier master profile	Trusted supplier identity and verified bank account ending 4321
2	Purchase order PO-2026-0108	Approved items and transaction total of RM 11,188.80
3	Original invoice INV-2026-0182	Requests payment to bank account ending 6789 and omits the PO reference
4	Reissued invoice INV-2026-0182	Different PDF layout and file hash, but the same invoice identity and amount
5	Delivery order DO-2026-0097	Confirms the physical quantities and links the PO and invoice
6	Payment receipt PAY-2026-0255	States that the invoice was already settled to the unverified account

Expected normalized transaction

FIELD	NORMALIZED VALUE	SOURCE
Transaction ID	TXN-2026-0108	Generated by system
Supplier	Nexa Office Solutions	All business documents
Supplier ID	SUP-001	Supplier profile
Invoice number	INV-2026-0182	Both invoice PDFs and receipt
PO number	PO-2026-0108	PO and delivery order
Currency and total	MYR 11,188.80	PO, both invoices, and receipt
Verified bank account	*****4321	Supplier profile
Requested/paid account	*****6789	Invoices and receipt

Automation sequence

STEP	AUTOMATION ACTION	EXPECTED RESULT
1	Create batch and store originals	Six immutable PDF records with separate document IDs
2	Classify every PDF	Profile, PO, two invoices, delivery order, and payment receipt
3	Extract and normalize separately	ISO dates, MYR decimals, canonical supplier key, normalized references, and masked accounts
4	Resolve supplier identity	Registration number and normalized name resolve every document to SUP-001
5	Link documents	Exact references plus amount, supplier, items, and dates connect the six records
6	Run deterministic checks	Duplicate, bank mismatch, missing PO reference, overdue status, and payment-status conflict
7	Generate explanation	High risk with evidence from the source PDFs
8	Human review	Block another payment and verify the beneficiary change and existing transfer

Expected findings

FINDING	EVIDENCE	POINTS
Duplicate invoice	Two different PDFs use INV-2026-0182 for the same supplier and amount	+15
Bank-account mismatch	Verified account ends 4321; invoices and receipt use 6789	+20
Payment-status conflict	Invoices say UNPAID; receipt says SETTLED	+15
Missing PO reference	Invoices omit the PO although other evidence links the transaction	+10
Overdue invoice	Due 15 August 2026 and unresolved by the review date	+10
TOTAL RISK	High - human verification required	70/100

Expected system recommendation

HIGH RISK

Block any additional payment. Verify the supplier's requested bank-account change through an approved channel, confirm the existing transfer, mark one invoice as a duplicate, update the payment status, and record the reviewer decision.

Three-minute demonstration

0:00-0:30 - Explain the manual problem and upload the six PDFs. 0:30-1:15 - Show classification and normalized fields. 1:15-2:00 - Open the linked transaction and demonstrate the duplicate and cross-document comparisons. 2:00-2:35 - Show the explainable 70/100 risk score and masked sensitive fields. 2:35-3:00 - Select Block Payment, request bank verification, and show the audit event.
